TakeSure — demo video narration (2:40)

Read over the silent MP4 **TakeSure_Demo_KriticalHacks2026.mp4** in Clipchamp or CapCut. Each row matches one scene; the time column is where that scene starts. Speak calmly; the captions already carry the facts, so your voice can tell the story.

Rules: no key or secret on screen or in words · say "prototype" not "product" · never say "safe to take"; say "the evidence says" · mention TinyFish by name at least twice.

Time	Scene on screen	Say
0:00	Title card	"This is TakeSure — confidence before taking something. An Ayurveda-and-allopathy interaction checker, built by Team Bug Hunters."
0:04	Problem card	"A thyroid patient on Thyronorm starts ashwagandha for stress. Her doctor never asks, the chemist has no tool, the label says nothing. Only nineteen percent of Indian patients tell their doctor about the herbs they take. And no public tool checks an Ayurvedic product against a prescription."
0:11	Home page	"TakeSure is a phone-first web app in Hindi and English. No account, and photos are deleted the moment they are read."
0:16	Step 1 · type names	"Step one: photograph the prescription and the product, or just type the names. Here, Thyronorm and Ashwagandha."
0:22	Step 2 · review	"Step two: review. Thyronorm was matched to its generic, levothyroxine, through our Indian brand dictionary. Nothing is checked until the user confirms."
0:28	Step 3 · AMBER verdict	"Step three: the verdict. AMBER — caution. Look at the rule under it: severity moderate. That colour did not come from AI. It came from a cited row in our knowledge base."
0:35	Sources	"Every verdict shows its evidence: the matched interaction, grade B, the mechanism, what doctors usually do, and the published sources with their DOI or PubMed id."
0:41	Hindi result	"One tap, and the same answer in Hindi. The AI only rewrites the matched evidence and drafts three questions for the doctor."
0:46	RED result	"Guggul with warfarin is RED: blood thinners are a high-risk class, so the rule escalates. And when we do not know a pair, we say 'not in database'. We never guess green."
0:51	ADR form	"If something goes wrong, a one-tap reaction report in the Ministry of Ayush format, exported as a PDF for the Ayush Suraksha portal."
0:55	TinyFish card	"Now the part that makes the knowledge base grow: TinyFish. TinyFish is our research assistant. Its Fetch API verifies every citation, Search finds product pages, and the Web Agent reads monographs and drafts

		candidate rows. Every draft is reviewed by a person, and the verdict path never touches the live web."
1:02	Evidence curation panel	"This is live. On our first run TinyFish re-opened all seventy-eight citations and verified fifty-five automatically — through the page, the Crossref record or a search. It flagged twenty-three for review and caught three dead links in our own references."
1:10	Draft queue	"Discover drafted seven candidate interactions for ashwagandha and four for turmeric from the MSKCC monographs in seconds, and a Web Agent run mapped Dabur Giloy Ghanvati to its herb. Each draft waits here for approve or reject."
1:18	Dashboard	"Every check leaves an anonymous record. Aggregated, this is what the Ministry's pharmacovigilance network lacks today: what India is actually mixing."
1:23	Closing card	"Verdict from published data; AI only explains. Indian brands, Hindi, honest grades, and a TinyFish-assisted, human-approved knowledge base. TakeSure. Pehle check karo, phir lo."

Timing note: the silent MP4 runs about 2:40 because the captions need reading time. If you record voice, you can cut each scene to the length of your sentence and land at about 2:10.
