TakeSure — demo video narration (screen recording, 2:00)

For **TakeSure_Demo_ScreenRecording.mp4** on the Desktop: a real browser walkthrough of the live prototype (cursor, typing, clicks, scrolling). The time column is where each part starts. Read the line as that part appears.

Rules: say "prototype", not "product" · never "safe to take", say "the evidence says" · say TinyFish by name at least twice · no keys or secrets on screen or in words.

Time	What is on screen	Say
0:00	Home page, scrolling	"Hi, we are Team Bug Hunters, and this is TakeSure — confidence before taking something. In India, patients take Ayurvedic products alongside allopathic medicines every day, and nobody checks the pair. TakeSure is a web app that checks it, in Hindi or English, using published evidence."
0:20	Safety checker, typing Thyronorm 50 and Ashwagandha	"Step one: you can photograph the prescription and the product, or type the names. I am typing Thyronorm, which is a brand name, and Ashwagandha."
0:36	Review page	"Step two: review. Thyronorm was matched to its generic, levothyroxine, through our Indian brand dictionary. Nothing is checked until the user confirms."
0:43	AMBER result, scrolling to sources	"Step three: the verdict. AMBER — caution. The rule is shown under it: severity moderate. This colour did not come from AI; it came from a cited row in our knowledge base. Below it, the AI only rewrites that evidence in simple words and drafts three questions for the doctor. And here are the sources, with evidence grade and the DOI or PubMed id."
1:07	Hindi toggle	"One tap, and the same answer in Hindi. The verdict does not change; only the language does."
1:12	Dashboard	"Every check leaves an anonymous record. This is the Ministry view: verdict trends, top combinations, reaction reports."
1:18	Evidence curation panel (TinyFish)	"Now the part that grows the knowledge base: TinyFish. TinyFish is our research assistant. Its Fetch API re-opened all seventy-eight of our citations and verified fifty-five automatically. The Web Agent reads monographs and drafts candidate rows, and Search plus Agent map Indian products to their herbs."
1:28	Draft queue, details opened	"Each draft lands here with its source and TinyFish run id, and a person approves or rejects it. The verdict path never touches the live web — that is a safety rule."
1:43	Knowledge base	"This is the knowledge base: forty-nine cited interactions today, searchable by brand name or in Hindi."

1:50	ADR form	"And if something goes wrong, a one-tap reaction report in the Ministry of Ayush format."
1:57	Home page	"TakeSure. Verdict from published data; AI only explains. Pehle check karo, phir lo."

How to add your voice (Clipchamp, about 20 minutes)

1. Open Clipchamp (it is on Windows 11) → Create a new video → drag **TakeSure_Demo_ScreenRecording.mp4** onto the timeline.
2. Left bar → **Record & create** → **Audio**. Play from the start and record while reading the lines above as each part appears.
3. If you stumble, stop and re-record just that part; drag each clip so it starts at the time in the table.
4. Export → 1080p → save as **TakeSure_Demo_Voice.mp4**. Upload that one.

Prefer to record it yourself from scratch? Press **Win + Alt + R** (Xbox Game Bar) with the site open in Chrome at **http://localhost:3000**, follow the same click path as the table (home → Check safety → Type the names → Match → Confirm → scroll the result → हिन्दी → Dashboard → Evidence curation → mismatch → Details → Knowledge base → Report a reaction), and talk while you click. Press Win + Alt + R again to stop; the file is in Videos\Captures. Either video is fine for the submission.
