TakeSure — Demo Video Script & Production Guide

CodeSlayer 2.0 2K26 · Round 1 (Online Ideation) · Team Bug Hunters · Target length 2:45–3:05

> **The one rule that decides everything.** The organisers wrote: *"this round is for idea presentation only. If we find that a team has already built a prototype or working solution, that team will be disqualified."* So this video explains the **idea, the design and the plan**. It never shows a running website, an app screen, a screen recording, code, a URL or a QR code. Everything is said in the future or conditional tense: **"the user will photograph…", "the system will check…", "in the 36 hours we will build…"**. Never "we built", "we tested", "our prototype shows", "it already works".

1. What the organisers asked for

Requirement	How this script meets it
At least 2–3 minutes long	Script runs 2:50–3:05 at a normal speaking pace. Do not cut below 2:30.
Face of at least one team member clearly visible	Dhriti, Shiwani and Khushi each appear on camera; the speaker's face is on screen for every segment (full frame or picture-in-picture over the slide).
Explain only the project idea	Segments cover problem → idea → how it would work → why it is different → feasibility → impact. No demo, no product footage.
Idea presentation only; no prototype	Visuals are your six PPT slides and the flowchart from slide 3 (a design diagram). Optional: a hand-drawn paper sketch of the result card, clearly a sketch.
PPT submitted on Unstop; video link inside the PPT	Upload the MP4 to Google Drive, "Anyone with the link can view", paste the link on slide 1, test it from a phone that is not logged into your account.

2. Structure at a glance

Time	Segment	Speaker	On screen
0:00–0:22	Hook	Dhriti (camera)	Dhriti on camera, holding a medicine strip in one hand and an ashwagandha bottle in the other
0:22–0:38	Team & problem statement	Dhriti	Slide 1, speaker in corner
0:38–1:08	The problem in numbers	Khushi (camera)	Slide 2; zoom on the four stat tiles
1:08–1:55	Our idea: how TakeSure would work	Shiwani (camera)	Slide 3 flowchart, pointer moving top to bottom

1:55–2:20	Why it is different & how we keep the AI honest	Dhriti	Slide 3 novelty box, then comparison table
2:20–2:42	Can we build it in 36 hours?	Khushi	Slide 6 (feasibility), slide 4 (architecture) briefly
2:42–2:58	Business model & impact	Shiwani	Slide 5
2:58–3:05	Close	All three (camera)	All three on camera, team name + project name as text

Speaking pace: about 140 words per minute. The full script below is ~430 words of spoken text, which lands at ~3:00 with natural pauses. If you run long, cut the Hindi lines in the hook and close first; they are optional.

3. The script — word for word

0:00 – 0:22 · HOOK

Dhriti, full frame, facing camera. Hold up the strip, then the bottle.

"Meri mummy thyroid ki dawai leti hain… aur stress ke liye ashwagandha bhi."

"Nobody ever told her that this combination can push her thyroid dose out of range. Crores of Indians take Ayurveda and allopathy together — and between the two systems, there is no safety check at all."

"We are Team Bug Hunters, and our idea is TakeSure — confidence before taking something."

On screen: Dhriti on camera. Optional lower-third text: "TakeSure · Confidence before taking something".

0:22 – 0:38 · TEAM & PROBLEM STATEMENT

Dhriti, picture-in-picture over slide 1.

"We are three students: I'm Dhriti, I lead the rule engine and the pitch; Shiwani designs the web app and the Hindi-English experience; Khushi leads the medical research and the knowledge base. Our track is Healthcare. The problem we chose: a herb–drug interaction checker for Ayurveda and allopathy — a photo of the prescription and a photo of the Ayurvedic product, in; a sourced, plain-language safety verdict, out."

On screen: slide 1 for the whole segment.

0:38 – 1:08 · THE PROBLEM IN NUMBERS

Khushi, full frame for the first sentence, then picture-in-picture over slide 2.

"How big is this? In a hospital study from Udupi, **37 percent** of patients were taking allopathic and herbal medicines together, and **65 percent** did not know about doses, side effects or interactions. Only about **19 percent** of Indian patients ever tell their doctor about herbal use. And the Ministry of Ayush's pharmacovigilance programme has received only about **1,473** adverse-event reports since 2018 — massive under-reporting."

"The doctor rarely asks, the patient rarely tells, the chemist has no tool, and the label says nothing. Existing checkers like Medscape or 1mg only know allopathic-to-allopathic pairs. Nobody checks Thyronorm against ashwagandha, or warfarin against guggul."

On screen: slide 2; zoom into each stat tile as it is spoken.

1:08 – 1:55 · OUR IDEA: HOW TAKESURE WOULD WORK

Shiwani, picture-in-picture over the slide-3 flowchart. Move a pointer or highlight box down the chart as you speak.

"Here is how TakeSure would work. **Step one, Scan:** the user photographs the prescription and the Ayurvedic product label — or simply types the names. OCR reads the text, and every name is shown back to the user for confirmation before anything is checked."

"**Step two, Match:** Indian brand names become generics — Thyronorm becomes levothyroxine — and products become their herbs, so Chyawanprash maps to amla, ashwagandha and the rest."

"**Step three, Decide:** a rule engine looks up every herb–medicine pair in a curated knowledge base, where each row carries a severity, an evidence grade A, B or C, and a published source. The result is Green, Amber, Red — or 'Not in database' when we simply don't know. We will never guess."

"**Step four, Explain:** only now does AI come in. It rewrites the matched evidence into simple Hindi or English and drafts three questions to ask the doctor. **Step five, Report:** a one-page PDF for the doctor, and a suspected-reaction report pre-filled in the Ministry of Ayush format."

On screen: the flowchart only. Do not show any app screen. If you want a visual of the result card, draw it on paper and film the paper — clearly a sketch.

1:55 – 2:20 · WHY IT IS DIFFERENT & HOW WE KEEP THE AI HONEST

Dhriti, picture-in-picture; slide 3 novelty box, then the comparison table.

"Two things make TakeSure different. First: **the verdict comes from published data; the AI only explains.** The risk level never comes from a language model — it comes from a cited, versioned knowledge-base row. If you switch the AI off, the verdict stays identical. That is the opposite of a ChatGPT wrapper."

"Second: **the bridge table nobody has built** — Indian brand names, Ayurvedic herb synonyms in Sanskrit, Hindi and Latin, and graded published evidence, in one open, auditable table. Medscape doesn't have it. Western herb databases are English-only and don't know Himalaya or Dabur."

On screen: novelty bullets, then the star-rating comparison table for 6–8 seconds.

2:20 – 2:42 · CAN WE BUILD IT IN 36 HOURS?

Khushi, picture-in-picture over slide 6, then slide 4 for a few seconds.

"Yes — because every component is proven and off the shelf: OCR, fuzzy name matching, a relational lookup, and an LLM for rephrasing. No model training. Our plan for the hackathon: a web app in Next.js, a FastAPI backend, a SQLite knowledge base of around forty high-frequency herb–drug pairs that we are researching now from PubMed, LiverTox, MSKCC and WHO monographs — and the whole thing runs offline on a laptop, so Wi-Fi can't stop us."

"The risks we see — OCR misreads, unknown herbs, AI hallucination — each have a mitigation on our slide. The biggest one is simple: the AI never decides anything."

On screen: slide 6 risk table, then the architecture row of slide 4.

2:42 – 2:58 · BUSINESS MODEL & IMPACT

Shiwani, picture-in-picture over slide 5.

"TakeSure is free for citizens. It earns through an API for pharmacy chains, hospital systems and telemedicine apps, and through programmes with the Ministry of Ayush, whose pharmacovigilance network finally gets structured reports and real co-use data. Later, the verdict can sit on the patient's ABHA health record through ABDM."

On screen: slide 5 — business model tiles, then the impact numbers.

2:58 – 3:05 · CLOSE

All three on camera together.

Dhriti: "We are not building another AI chatbot."

Khushi: "We are building the missing safety data between two medical systems — made auditable —"

Shiwani: "— and connected to the Ministry's own reporting pipeline."

All: "TakeSure. Lene se pehle, sure ho jao. Thank you."

On screen: all three faces; text overlay "TakeSure · Team Bug Hunters · CodeSlayer 2K26". No link, no QR code.

4. How to shoot and edit it (free tools, one evening)

Recording

- Phone camera, **landscape**, 1080p, 30 fps. Clean the lens.
- Face the window or a lamp; never have the light behind you. A plain wall behind you is best.
- Audio matters more than video: use wired earphones with a mic, or record in a quiet room 30–50 cm from the phone. Switch off fans and phones.
- Record **each segment separately**, 2–3 takes each. Read from a teleprompter app (e.g. "Teleprompter" on Android/iOS, or BIGVU free) with the script above pasted in.
- Speak a little slower than normal and smile at the camera at the start and end of each take.
- For the hook, hold the strip and the bottle at chest height so both are in frame.

Editing

- **Clipchamp** (already on Windows 11) or **CapCut** (free): one track for the slide images, one for the camera clips.
- Export each PPT slide as a PNG (PowerPoint → File → Save As → PNG → "All Slides"). Use them full-screen; place the speaker in a circle or rectangle in the bottom-right corner (picture-in-picture).
- Add captions / subtitles — Clipchamp does this automatically. Judges often watch on mute.
- Soft background music at 10–15% volume only; none under the hook.
- Export MP4, 1080p. Name it `BugHunters_TakeSure_CodeSlayer2K26.mp4`.
- Upload to Google Drive → Share → "Anyone with the link" → Viewer. Open the link from a friend's phone to confirm it plays.

5. Compliance checklist — tick every box before uploading

☐ Length between 2:30 and 3:30.

☐ At least one face clearly visible (yours: all three appear).

☐ No app screen, website, screen recording, code editor, terminal, URL or QR code anywhere in the video.

☐ No sentence that says or implies the product already exists ("we built", "it works", "our prototype", "live", "deployed", "users tested"). Replace with "will", "would", "we plan to", "in the hackathon we will build".

☐ Numbers match the PPT exactly (37%, 65%, 19%, 1,473).

☐ Team name spelled the same way everywhere: **Bug Hunters**.

☐ Drive link pasted on slide 1, sharing set to Anyone with the link, tested from another phone.

☐ PPT re-exported to PDF after pasting the link; PDF is what you upload on Unstop.

6. Judge questions you may get later — one-line answers

Question	Answer
Isn't this just ChatGPT for herbs?	No. The verdict comes from a versioned table with sources; the model only rewrites the matched row and is schema-locked. Switch it off and the verdict is identical.
What if the herb or medicine isn't in your database?	We say "Not in database" and never guess. Every miss is logged as a curation task.
Who is liable if the advice is wrong?	It is decision support: we never say stop or start; we show evidence and questions for the doctor — the same posture as Medscape or Drugs.com.

OCR on Indian handwriting?	The user confirms every name before any lookup, and manual entry is always available.
How does the Ministry benefit?	Structured ICSRs in its own format, co-use analytics by state, and signal detection — feeding the existing NPvCC and Ayush Suraksha system, not duplicating it.
Evidence is weak for many herbs.	Exactly why every result shows an A/B/C grade. Weak evidence shown as weak is itself information a patient never had.
Business model?	Free for citizens; API for pharmacies, hospital systems and telemedicine; Ministry programmes and CSR from Ayurvedic brands; ABDM integration later.

7. PPT fixes recommended before submission (not applied — your call)

Critical — slide count. Your deck has **7 slides**. The template's last page says: *"Keep your submission to a maximum of 6 slides, including the Title Slide."* Slide 7 (References & Comparison Table) puts the whole submission at risk of being rejected on a technicality. Fix: move the comparison table into slide 5 (replace the "Who benefits" strip at the bottom — the comparison belongs under USP anyway) and put 4–5 compact references under the stats on slide 2 or inside the "Data & Evidence" box on slide 6. Then delete slide 7.

Critical — title bar. Slide 3's title reads "TAKESURE-OUR UNIQUE SOLUTION". The template says *"Do not change the title bar."* Change it back to **OUR UNIQUE SOLUTION**. Also the team oval on slide 3 is empty — put "Bug Hunters" in it.

Slide	Rating	What works	What to fix
1 Title	7 / 10	Clean, template intact, roles clear, tagline strong.	"Tracks Chosen: Healthcare ·" has a stray dot — either remove it or add **AI/ML** and **Open Innovation** (you qualify, and AI/ML makes you eligible for the Best AI/ML Team special prize). Paste the Drive link. Missing space in "Khushi Gupta—".
2 Problem	9 / 10	Best slide: story, four numbers, three user groups. Judges will read this one fully.	Team name "BugHunters" vs "Bug Hunters" on slide 1 — make it consistent everywhere.
3 Solution	8 / 10	Flowchart is excellent and clearly a design, not a screenshot. Five steps + novelty cover the idea completely.	Revert the title bar; fill the oval; the second Novelty point is missing its bullet mark; flowchart text is small — enlarge the chart to the full height of the slide if possible.
4 Tech	9 / 10	Clear stack, clean architecture cards, the three "Flow" boxes answer the hard questions.	Typo "BugHuters" in the oval. Hosting line says Vercel + Render — fine as a plan; keep it future-tense in the video.
5 USP & Business	9 / 10	Strong structure, four revenue layers, impact numbers.	If you move the comparison table here (see critical fix), keep the Impact tiles and drop "Who benefits".
6 Feasibility	8 / 10	Very thorough; the six-row risk table is exactly what judges look for.	OCR is "Google Vision / Paddle OCR" here but "Tesseract" on slide 4 — align them (e.g. "Tesseract or PaddleOCR locally; Google Vision optional"). Fix the odd gap in "unless user opts in". It is dense: trim 2–3 bullets so it breathes.
7 References & Comparison	7 / 10	Good content; star table is attractive; references are relevant.	Must not exist as a 7th slide (see above). Also consider rating yourselves 4/5 on "Sources" instead of a perfect 5.0 — judges trust a team that leaves itself one gap.

Overall as it stands: **8 / 10 on content, but a rules risk on slide count and the altered title bar.** Fix those two and this is a shortlist-grade deck.
